

OMTF è la serie delle linee di ritorno; la gamma comprende quattro diverse dimensioni con portate nominali fino a 500 L/min. Gli elementi filtranti sono realizzati con i materiali più avanzati, a garanzia di un'alta efficienza di filtrazione e di una lunga durata.

OMTF is the series of return lines; the range includes four different sizes with nominal flow rates up to 500 L/min. Filter elements are made with the most advanced materials, as a guarantee for a high filtration efficiency and a long-lasting life.

Il valore della caduta di pressione totale (Δp) si ottiene sommando, il valore Δp del corpo filtro e dell'elemento filtrante ad una data portata. Questo non deve idealmente superare 0.5 bar (7,3 psi) e non dovrebbe eccedere 1/3 del valore di taratura della valvola di by-pass.

La caduta di pressione dipende dalla viscosità dell'olio mediamente in maniera direttamente proporzionale.

The total Pressure Drop (Δp) value is obtained by adding the Δp values of filter housing and filter element at the given flow rate.

This ideally should not exceed 0,5 bar (7,3 psi) and should never exceed 1/3 of the set value of the by-pass valve.

The Pressure Drop is affected by the oil viscosity in a roughly proportional way.

NB. La caduta di pressione (Δp) attraverso il filtro cresce durante l'utilizzo. L'elemento filtrante deve essere sostituito quando l'indicatore lo segnala e prima che Δp raggiunga il valore di taratura della valvola di by-pass. Accertarsi che l'indicatore non dia un falso allarme in caso di partenza a freddo (alta viscosità dovuta a bassa temperatura).

NB. The Pressure Drop (Δp) through the filter increases during the system operation. The cartridge must be replaced when the indicator shows and before the Δp reaches the by-pass value setting. In cold start conditions a false alarm can be caused by higher oil viscosity due to low temperature.
